

RallySafe Bulletin

Subject: 3-in-1 External Antenna's & Radio
Date of Bulletin: 4th November 2025
Effective Date: Effective immediately
Page: 1 of 1
To: Australia and New Zealand Event Organisers and Competitors.

With the recent (or upcoming) rollout of our new RallySafe units, it's important to ensure your vehicle is fitted with the most up-to-date antenna wiring.

It has come to our attention that some competitors may still be using the **2-in-1** external antennas (Iridium and GPS only). **These were phased out in 2014.**

The latest setup should include the following connections:

3-in1 External Antenna Connections:

- Iridium Satellite (Yellow)
- GPS Satellite (Green)
- Car-to-Car Radio (Blue) – previously advised to be tucked away, as original RallySafe units did not have a second blue connection.

Internal Radio Antenna:

- Car-to-Car Radio (Blue) – this serves as a backup in the event your external antenna is damaged. It allows messages to continue transmitting via approaching vehicles, then to race control.

RallySafe has been manufacturing **3-in-1 external antennas** for approximately 10 years, and the latest RallySafe unit requires the 4 antenna connections (**Yellow, Green, Blue, and internal blue**), as pictured below.

Please check your setup before your next event, to ensure your vehicle is compatible with the latest RallySafe units. You can purchase these via the shop:
