HOW TO USE QR CODES

APPLE

Yes, you can 'scan' a QR code present on your own iPhone. It is enabled by Apple's [Live Text](#) feature in iOS 15 and later. Here are the steps:

1. Take a screen grab picture of the QR Code, save to photos
2. In Photos app, browse to an image of the QR code.
3. A grey Live Text icon should automatically appear in the lower right corner.
4. Tap it to turn on Live Text – the icon will turn blue.
5. Tap the QR code.
6. Options will appear for using Google Maps or the phone number embedded in the QR code.
7. Select Google Maps.....and you are off.
- 8.

Android - How to scan QR codes without a camera.

Circle to Search lets you easily scan QR codes without a camera. This is especially useful when scanning QR codes embedded in emails, PDFs, photos, apps or videos on your device (known as on-content QR codes). To scan QR codes without a camera using Circle to Search:

1. Press and hold the home button of your Android device.
 - If you're using gesture navigation, long-press the navigation button instead.
2. A Google search bar will appear on your screen, indicating Circle to Search is ready.
3. Circle the QR code with your finger and Circle to Search will automatically scan it, displaying the information or link associated with the code.
