The first two steps are relatively straightforward. The third step involves identifying the specific components of the system that are most likely to cause problems. This can be done by reviewing the system's design documentation, conducting interviews with users, or performing a detailed analysis of the system's behavior. Once the components have been identified, the next step is to develop a plan for testing each component. This plan should specify the test cases, the test environment, and the expected results. Finally, the testing process should be documented, and the results should be reported to the appropriate stakeholders.
